The **nag** package*

Dr. Ulrich Michael Schwarz†

November 27, 2011

**Abstract**

Old habits die hard. All the same, there are commands, classes and packages which are outdated and superseded. nag provides routines to warn the user about the use of those. As an example, we provide an extension that detects many of the “sins” described in l2tabu.

*This document corresponds to nag 0.7, dated 2011/11/19. Other versions can be found at http://absatzen.de/
†ulmi@absatzen.de
1 User-side considerations.

1.1 Installation.

Process \texttt{nag.ins} with \LaTeX{} to obtain some files: \texttt{nag.sty} and \texttt{nag-l2tabu.cfg} et al. must go to a place where \LaTeX{} will find them, like the local TEXMF tree. (If all else fails and you need it to work right now, having them in the same directory as the \LaTeX{} file you want to use them on may work under many circumstances.) You can, as usual, run \LaTeX{} on \texttt{nag.dtx} to obtain this documentation, including the implementation docs. (This is recommended if you plan to extend \texttt{nag} to handle your own packages.) \texttt{nagdemo.tex} is a horrible document that will show you many of the warnings that \texttt{nag} can generate.

1.2 Usage.

Add the following to the beginning your main document (Comments and \texttt{\listfiles} can be safely left before it, though):

\begin{verbatim}
\RequirePackage[l2tabu, orthodox]{nag}
\end{verbatim}

This will check for many common mistakes, and give some hints on what to use instead. However, you should always refer to l2tabu for a more detailed explanation of the whats and whys: it gives more information than can be possibly pressed into two lines of error message. Orthodox checks for pitfalls that are not technically incorrect. If you know what you’re doing, omit orthodox.

1.3 Known bugs

Currently none.

1.4 \texttt{nag-l2tabu.cfg}

In a nutshell, \texttt{nag-l2tabu.cfg} detects the following:

- Usage of the 2.09-style font commands \texttt{\it}, \texttt{\bf}, \texttt{\rm}, \texttt{\sc}, \texttt{\sl}, \texttt{\tt} and \texttt{\cal}.
- Usage of \texttt{\centerline}.
- Usage of the outdated packages \texttt{epsfig}, \texttt{psfig}, \texttt{epsf}, \texttt{doublespace}, \texttt{fancyheadings}, \texttt{scrlf}, \texttt{umlaut}, \texttt{isolatin}, \texttt{isolatin1}, \texttt{tlenc}, \texttt{caption2}, \texttt{psfonts}, \texttt{mathpmt}, \texttt{times}, \texttt{palatino}, \texttt{mathppl}, \texttt{euler} and \texttt{utopia}, and of the outdated class \texttt{scrlttr}.
- Figures and tables without caption (this is not technically in l2tabu, but the people who have floats without captions tend to ask “Why is \LaTeX{} moving my pictures away from where I put them?”), labels within floats that do not reference the caption, and usage of the center environment within floats.
It is beyond the possibilities of this package to detect things like use of \texttt{\TeX} assignment syntax, or direct change of paper parameters, or reliable detection of user-issued \texttt{\lq\lq sloppy\rq\rq}. eqnarray is handled as of 0.60alpha4, and there is code for \texttt{\$\$} in experimental since 0.60alpha4, which has been moved to l2tabu in 0.60.

Be warned, that this package will possibly balk at legitimate use, and not find illegitimate use in all cases. It is a tool, not a replacement for study of l2tabu.

11 \%

Hacking galore ahead! We will make the dollar active. Since unlike onlyamsmath, we do not change the user’s command to LATEX or amsmath commands, we need to store the old double dollar sequence as well as the single dollar.

12 \def\nag@doubledollar{$$}%$$
13 \def\nag@singledollar{$}%$

This is used to hide our redefinition in unprotected expanding context. This should not happen: you are expected to always use protected means of expansion in LATEX, but fecal matter happens. See below for a good trick to distinguish expansion from executing context.

14 \def\nag@expanding@voodoo#1#2#3{elax\relax\nag@singledollar}
15
16 \def\nag@maybedispmath{%
17 \texorpdfstring{%
18 \ifinner\expandafter\@firstoftwo
19 \else\expandafter\@secondoftwo\fi
20 \ifx\protect\@typeset@protect\expandafter\@firstoftwo
21 \else\expandafter\@secondoftwo\fi
22 \nag@singledollar%}
23 \nag@maybe@dispmath}}%
24 \nag@expanding@voodoo#1#2#3{\relax\relax\nag@singledollar}
25 \nag@maybedispmath%
If the user doesn’t load hyperref, we have to fake its \textorpdfstring command. Note that this will break any package that is foolish enough to detect \hyperref by testing for definedness of \textorpdfstring.\n
\AtBeginDocument{\providecommand\textorpdfstring{\@firstoftwo}}\n\AtBeginDocument{\catcode$\active}%$\n\AtEndDocument{\catcode$=3\relax}\n
Now, the proper testing. (Yes, the above is just the technicalities.) We use the kernel's \@ifnextchar to look for a possible second dollar. Note however, this would allow skipping of spaces between them, and \$_$ is not a displayed equation start in \TeX. We work around this by re\letting \@sptoken to something that cannot legally appear in the source.

\def\nag@quark{\nag@quark}\n\bgroup\n\catcode$\active%$\n\gdef\nag@maybe@dispmath{\bgroup\n\let\@sptoken\nag@quark% prevent skipping of spaces\n\@ifnextchar${%$\n\ifmmode% we already warned upon entering.\n\else\n\nag@warn{%\n\nag@doubledollar...\nag@doubledollar\space is obsolete.\MessageBreak\nUse \string[...\string] et al. instead}%\n\fi\n\egroup\expandafter\nag@doubledollar\@gobble\n}\n\egroup\nag@singledollar\n\n\% we do the assignment here, which means any package that redefines\n\% \$ as well will silently disable us. This is a feature.\n\%\n\global\let$\nag@maybedispmath$\n\egroup\n
new in 2.1alpha1: more compat testing. Version control keywords are dollar-delimited. all five implementations get it wrong.

\section*{2.1 Classes and Packages}

\subsection*{2.1.3 Centerline Environment}

\begin{itemize}
  \item \texttt{\texttt{centerline}} (the \texttt{centering} environment)
\end{itemize}

\subsection*{2.2 Classes and Packages}

\subsubsection*{2.2.1 \texttt{scrlttr2} Package}

\begin{itemize}
  \item \texttt{\texttt{scrlttr}} (the \texttt{scrlttr2} package)
\end{itemize}

\subsubsection*{2.2.2 \texttt{graphicx} Package}

\begin{itemize}
  \item \texttt{epsf} (the \texttt{graphicx} package)
  \item \texttt{psfig} (the \texttt{graphicx} package)
  \item \texttt{deprecatedepsfig} (the \texttt{graphicx} package directly)
\end{itemize}

\subsubsection*{2.2.3 \texttt{setspace} Package}

\begin{itemize}
  \item \texttt{\texttt{setspace}} (the \texttt{setspace} package)
\end{itemize}

\subsubsection*{2.2.4 Fancy Headings}

\begin{itemize}
  \item \texttt{fancyheadings} (the \texttt{fancyhdr} or \texttt{scrpagem} packages)
  \item \texttt{\texttt{scrpage}} (the \texttt{scrpagem} package)
\end{itemize}

\subsubsection*{2.2.5 \texttt{inputenc} Package with Option Latin1}

\begin{itemize}
  \item \texttt{isolatin} (the \texttt{inputenc} package with option latin1)
  \item \texttt{umlaut} (the \texttt{inputenc} package with suitable option)
  \item \texttt{\texttt{isolatin}^1} (the \texttt{inputenc} package with option latin1)
\end{itemize}

\subsubsection*{2.2.6 Font Encodings}

\begin{itemize}
  \item \texttt{\texttt{isolatin}^1} (the \texttt{inputenc} package with option latin1)
  \item \texttt{\texttt{t1enc}} (the \texttt{fontenc} package with option T1)
\end{itemize}

\subsection*{2.3 Classes and Packages}

\subsubsection*{2.3.1-3 Times Fonts}

\begin{itemize}
  \item \texttt{\texttt{times}} (the \texttt{mathptmx}, \texttt{helvet} (option scaled=.9), \texttt{courier} packages)
  \item \texttt{\texttt{pslatex}} (the \texttt{mathptmx}, \texttt{helvet} (option scaled=.9), \texttt{courier} packages)
  \item \texttt{\texttt{mathptm}} (the \texttt{mathptmx} package)
\end{itemize}

\subsubsection*{2.3.4-5 Palatino Fonts}

\begin{itemize}
  \item \texttt{\texttt{palatino}} (the \texttt{mathpazo}, \texttt{helvet} (option scaled=.95), \texttt{courier} packages)
  \item \texttt{\texttt{mathppl}} (the \texttt{mathpazo} package)
\end{itemize}

\subsection*{2.3.6 Euler and Fouriers}

\begin{itemize}
  \item \texttt{\texttt{euler}} (the \texttt{eulervm} package)
  \item \texttt{\texttt{utopia}} (the \texttt{fourier} package)
\end{itemize}

\subsection*{3.1 User Options}

\begin{itemize}
  \item User options for \texttt{\texttt{times}}, \texttt{\texttt{palatino}}, \texttt{\texttt{euler}}, \texttt{\texttt{utopia}}
\end{itemize}
The latter two are used by KOMA-Script, the last by hypcap.

\changes{0.53}{2007/03/21}{hypcap support. (H.G.Krauth"auser)}

It's more trouble than it's worth to have another warning for align*, since it passes through align.
\ObsoleteEnv{eqnarray}{amsmath's align}

\S 3.4 -- nothing to be done --

1.5 nag-orthodox.cfg

nag-orthodox.cfg warns about usage that is not technically incorrect, but will mostly do things an unwary user may not expect. This includes in particular the usage of font size and style switches as environments (line spacing will be off if the environment does not contain a trailing \par, spurious spaces might occur since the switches don’t \ignorespaces), and, conversely, the usage of center etc. environments as unclosed switches. (Detection of the latter might still be somewhat brittle.)

\ProvidesFile{nag-orthodox.cfg}

More experimental code: warning about files that were requested but not there. The really important one would be a check for include (this is just a typeout in the kernel?!). But as it is, we get warnings that point out missing ToC, LoF etc.
2 Author-side considerations and implementation.

If you are a package or class author and want to extend the range of nag (or prevent nag from criticizing your macros), please see the description below, in sections 2.2 and following. It is probably wise to group new rules in a separate nag file: users can request nag files by passing their name as a package parameter, as shown above for the example of l2tabu.

2.1 Low-level tools.

Identify ourselves.

First of all, two counters we need. The first is used to generate running numbers for replacement macros, the latter is stepped for each complaint we have, so that the user gets a frighteningly high number, showing how sinful he or she is.
\nag@prepend \nag@prepend\{\langle cs\rangle\}\{\langle something\rangle\}: Prepend \langle something\rangle to the macro definition of \langle cs\rangle.

In reality, we do call indirection: save old macro away, redefine macro to do the something, call old macro. (With thanks to Juergen Goebel, Heiko Oberdiek and Rolf Niepraschck (\texttt{savesym}))

From 0.60\alpha_2 on, nag is more robust about not defining commands that are not there. Now, they’re not even relaxed.

\begin{verbatim}
\newcommand{\nag@ifundefined}[1]{% 
  \begingroup 
  \@ifundefined{#1}{\endgroup\@firstoftwo}{\endgroup\@secondoftwo}% 
}\end{verbatim}

Don’t define the macro if it’s not there. This confuses caption, which loads \texttt{ragged2e} \texttt{AtBeginDocument}, at which point, \texttt{RaggedLeft} et al. were already defined by us. …but do log a message.

\begin{verbatim}
\newcommand{\nag@prepend}[2]{% 
  \nag@ifundefined{#1}{% 
    % if it doesn’t exist, don’t do anything. 
    \PackageInfo{nag}{{\textbackslash backslashchar#1 space not defined, skipping amendment}}% 
  }{% 
    \nag@ifundefined{#1 }{% 
      \let\nag@maybespace\@empty 
    }{% 
      \let\nag@maybespace\space 
    }% 
    %\PackageInfo{nag}{{\textbackslash backslashchar#1 space appears robust,MessageBreak 
    \% Command ‘\textbackslash backslashchar#1 space’ instead.} 
    \%}% 
  }% 
  \@xa\let \csname nag@@#1@\thenag@c@xa\endcsname \csname #1\nag@maybespace\@xa\endcsname 
}\end{verbatim}

Fun with scoping: one might think we can get away with a (non-local) \texttt{\advance\c@nag@c 1} \texttt{\relax} here. This would lead to less hashtable usage. Problem: if a \texttt{nag@@foo@17} macro ever escapes its scope, it might be bound to something else entirely. This might occur with some of the fancier table packages which use external files?

\begin{verbatim}
\stepcounter{nag@c}%
\end{verbatim}
All complaints to the user run through one of these two macros, with or without source line.

2.2 Obsoletifying commands.

(No, I do not think that is a proper word either.)

Usage: \ObsoletEC\[⟨reason⟩\]{⟨CS⟩}{⟨suggestions⟩} Mark ⟨CS⟩ as obsolete. ⟨reason⟩ defaults to obsolete. When the macro is used anyway, the following warning is logged:
Command ⟨CS⟩ is ⟨reason⟩. Use ⟨suggestions⟩ instead.

\ObsoletEC
\newcommand\ObsoletEC[3][obsolete]{%
\AtBeginDocument{%
\nag@prepend{\#2}{%
\nag@warn{%
Command \backslashchar#2 is #1.
\MessageBreak
Use #3 instead}%
%
}%
}

\ObsoletEnv
\newcommand\ObsoletEnv[3][obsolete]{%
\AtBeginDocument{%
\nag@prepend{\#2}{%
\nag@warn{%
Environment #2 is #1.
\MessageBreak
Use #3 instead}%
%
}
2.3 Obsoletifying packages and classes.

Checking for packages and classes is done by looking for \texttt{ver@foo.sty}, which holds the version information that is also displayed by \texttt{\listfiles}. This means that we’re out of luck if fontenc ever becomes obsolete, because that won’t be detected.

First, define a macro to check if a control sequence is defined. Unlike \texttt{\@ifundefined}, this will not define the control sequence to \texttt{\relax}, but the arguments will be executed in a group. For our purposes, this doesn’t matter, because we only give a warning (and \texttt{\addtocounter} already is \texttt{\global}).

\begin{verbatim}
\newcommand{nag@ifcsname}[3]{\begingroup\@ifundefined{#1}{#3}{#2}\endgroup}
\end{verbatim}

Just because we can, use $\epsilon$\TeX\ `\ifcsname ifcsname ifcsname ifcsname ifcsname\fi'. This bootstrapping gives me a big grin...Note we add an extra group for compatibility with the non-$\epsilon$ case.

\begin{verbatim}
\nag@ifcsname{ifcsname}{\renewcommand*{\nag@ifcsname}[3]{\begingroup\% assume it won’t be there.\let\tmp@a@secondoftwo\ifcsname #1\endcsname\% It still might be \relax from some other test. Thanks to Jörg Sommer for finding this bug.\expandafter\ifx\csname #1\endcsname\relax\else\% it’s there after all\let\tmp@a\@firstoftwo\fi\fi\tmp@a{#2}{#3}\endgroup}}\nag@ifcsname
\end{verbatim}

This way of escaping the grouping gives me an even bigger grin.

\begin{verbatim}
\newcommand{\ObsoletePackage}[3][obsolete]{\AtEndDocument{\nag@ifcsname{#2.sty}{\nag@warnNoLine{\texttt{ObsoletePackage}\[\langle reason\rangle\]\[\langle package\rangle\]}\{\langle alternative\rangle\]. Mark \langle package\rangle as obsolete. \langle reason\rangle defaults to obsolete. If the \langle package\rangle is used anyway, at the end of the compilation, the following warning will be displayed:
\texttt{Package \langle package\rangle is \langle reason\rangle. Use \langle alternative\rangle instead.}\nag@ifcsname{ver@#2.sty}{\nag@warnNoLine}}\global\let\nag@ifcsname\nag@ifcsname}}
\end{verbatim}

\texttt{\ObsoletePackage}\ Usage: \texttt{\ObsoletePackage[\langle reason\rangle][\langle package\rangle][\langle alternative\rangle]. Mark \langle package\rangle as obsolete. \langle reason\rangle defaults to obsolete. If the \langle package\rangle is used anyway, at the end of the compilation, the following warning will be displayed:
\texttt{Package \langle package\rangle is \langle reason\rangle. Use \langle alternative\rangle instead.}\texttt{\nag@warnNoLine}}\%
Package #2 is #1. Use #3 instead

\SuggestedPackage Usage: \SuggestedPackage[⟨reason⟩]{⟨package⟩}
\newcommand\SuggestedPackage[2][might be useful to you]{%\
\AtEndDocument{%\
\nag@ifcsname{ver@#2.sty}{%\
% Attaboy!\
}%{\
\nag@suggestNoLine{%\
Not loaded: Package #2 #1}%\
}%{\
}
\}%

\IncompatiblePackages Usage: \IncompatiblePackages[⟨reason⟩]{⟨package⟩}{⟨package⟩}{⟨hint⟩}
\newcommand\IncompatiblePackages[4][are incompatible]{%\
\AtEndDocument{%\
\nag@ifcsname{ver@#2.sty}{%\
\nag@ifcsname{ver@#3.sty}{%\
\nag@warnNoLine{%\
Packages #2 and #3 #1.%\MessageBreak\
#4}%\
}%{\
}
%{\
}
\}%

\ObsoleteClass Usage: \ObsoleteClass[⟨reason⟩]{⟨class⟩}{⟨alternative⟩}. Mark ⟨class⟩ as ob-
owe. ⟨reason⟩ defaults to obsolete. If the ⟨class⟩ is used anyway, at the end of
the compilation, the following warning will be displayed:
Class ⟨class⟩ is ⟨reason⟩. Use ⟨alternative⟩ instead.
\newcommand\ObsoleteClass[3][obsolete]{%\
\AtEndDocument{%\
% \@clsextension| is only preamble, for some reason.\
\nag@ifcsname{ver@#2.cls}{%\
\nag@warnNoLine{%\
Class #2 is #1.%\MessageBreak\
Use #3 instead}%\

\nag@tmporder
}

2.4 Common float errors and no-nos.

We do the following:

- check for presence of a caption
- check for absence of the center environment
- check that a label comes only after a caption

First of all, we define two ifs to memorize whether we have a label and/or a caption in the float already. Package writers may want to set these manually behind \nag’s back. In this way, they can suppress possible warnings if they know what they’re doing — we only check at the end of the float environment, which gives them plenty of time to call \csname nag@haslabelltrue\endcsname et al. (Thanks to Markus Kohm for pointing out this need.) We initialize \nag@hascaption to be true because since 0.60, \label always checks if it’s after a caption, even outside of floats.

\newif\ifnag@haslabel
Now, to the work proper: as of 0.60, it is sufficient to set the label and caption flags to false. \texttt{endcenter} now always checks if it is inside a float (looking at \texttt{@captype}). The label and caption commands are amended only once. This should be sufficient: captions are not handled by letting \texttt{\caption} to the proper command upon float entry, so we assume nobody redefines \texttt{\caption} at runtime, or they provide more entries to \texttt{\nag@captions}. Similar for \texttt{\label}, and we do not care about the flag setting outside of floats.

Add checks to all macros named by \texttt{\nag@labels} and \texttt{\nag@captions}, respectively. Scoping of presence-of-caption information: Well, maybe I should do it the way the kernel does, which means a label is just as local as \texttt{\refstepcounter}'s \texttt{@currentlabel} information as of v0.4. I think we can leave captions global. Big old hack: we do this at \texttt{@preamblecmds}-time, which is after \texttt{\AtBeginDocument}, since hyperref loads nameref ABD, and nameref steps all over label. \textit{Note:} We cannot use \texttt{\nag@prepend} for this, since it would break the pkgindoc package, which nobody has ever heard of, but it’s in the kernel and relies on certain tokens being present in the expansion of \texttt{@preamblecmds}. Now, you pretty much cannot get any later than this.

\textit{Note:} we cannot exchange the order of the for loops here: if a cs generates both a label and a caption, it shouldn’t get complained about.
Define the lists of commands that are floats, generate labels, and generate captions, respectively. We don’t start with defined floats (that is for nag-l2tabu.cfg to set up). Since v0.52, we handle an empty name, so the lists may be empty. Also, no labels and captions are provided by default since v0.52. This has been moved to nag-l2tabu.cfg. See also \texttt{NagDeclareFloat}, which is the user-level wrapper for new floats. Since there are no packages to define new caption or label commands on an user level, there is no wrapper for those.

We call the above for each float environment named via \texttt{nag@floats}:

\begin{verbatim}
\newcommand\nag@floatsetup{% 
\@for\flo:=\nag@floats\do{% 
  \if\flo@empty\else 
    \nag@hackfloat\flo\nag@floatsetup\flo\nag@floatsetup\flo\fi 
}\fi
\end{verbatim}

but only after all other packages get their chance to add to the list:

\begin{verbatim}
\AtBeginDocument{\nag@floatsetup}
\end{verbatim}

At the very end, we will display a running total of complaints.

\begin{verbatim}
\AtBeginDocument{\AtEndDocument{% 
  \if\num\value{nag@sins}>0% 
    \PackageWarningNoLine{nag}{\arabic{nag@sins} complaints 
      in total}% 
    \else 
    \typeout{No complaints by nag.}% 
  \fi 
\end{verbatim}

3 Switch vs. Environment

People often use switches as environments and vice versa. This is dangerous in because it tends to almost work. (Consider font size commands in particular,
but also \texttt{centering} vs. \texttt{center} environment.) As usual, “it’s not an error if you know what you’re doing”. In particular, it is perfectly valid code to use the \texttt{foo...endfoo} syntax. So, \texttt{NotASwitch} needs to trace the calls to \texttt{foo} and see if they match with corresponding \texttt{endfoos} with its own stack. This might still be brittle. Fortunately, it is currently only needed for nag-orthodox, where it checks for the justification environments.

First of all, a helper macro we hinge upon:

\begin{verbatim}
\DeclareRobustCommand\nag@ifCurrentEnvironment[3]{% 
  \bgroup \def\tmp@a{#1} \ifx\@currenvir\tmp@a #2 \else #3 \fi \egroup }
\end{verbatim}

And now, the two variations there are:

\texttt{NotAnEnvironment} Usage: \texttt{NotAnEnvironment\{command\}} Issue an error if the user calls \texttt{\begin{command}} and not \texttt{\command} directly.

\begin{verbatim}
\newcommand\NotAnEnvironment[1]{% 
  \AtBeginDocument{% 
    \nag@prepend{#1}{% 
      \nag@ifCurrentEnvironment{#1}{% 
        \nag@warn{% 
          There is no environment ‘’#1’’.\MessageBreak 
          Maybe you want a grouped \@backslashchar#1 
        }{% OK case. }% 
      }{% OK case. }% 
    }{% OK case. }% 
  }{\relax}
\end{verbatim}

\texttt{NotASwitch} is a bit more involved:

\texttt{NotASwitch} Usage: \texttt{NotASwitch\{command\}} Issue an error if the user calls \texttt{\command} and not \texttt{\begin{command}} and mis-nests calls or doesn’t call \texttt{\endcommand} at all.

\begin{verbatim}
\newcommand\nag@envstack{\relax}
\DeclareRobustCommand\nag@beginenv[1]{% 
  \bgroup \@xa\toks@\@xa{\nag@envstack}{\relax} 
  \xdef\nag@envstack{% 
  \end{verbatim}
At the end, we complain about all the entries that are still on the stack.

\AtEndDocument{% 
\@for\@for=\looseends\do{% 
\nag@warnNoLine{Unmatched 
command on line
\@xa\@for\@xa\string\@xa\@for\looseends''
}% 
\fi
}%
\fi
}

\@for\@for=\looseends\do{% 
\nag@warnNoLine{Unmatched 
command on line
\@xa\@for\@xa\string\@xa\@for\looseends''
}% 
\fi
}%
\fi
}

At the end, we complain about all the entries that are still on the stack.
Now, the user-side command is easy.

\newcommand{\NotASwitch}[1]{%
  \AtBeginDocument{%
    \nag@prepend{#1}{%
      \nag@beginenv{#1}%
    }%
    \nag@prepend{end#1}{%
      \nag@endenv{#1}%
    }%
  }%
}

4 Compatibility issues

4.1 The caption package

Axel Sommerfeldt’s caption package loads the ragged2e package AtBeginDocument (regardless of whether it is needed). This is too late for us to amend the \RaggedFoo commands with \NotAnEnvironment. Since v0.51 of nag, they will then be skipped (with information in the log). Earlier versions would fail because by time ragged2e was loaded, the commands were already defined by the amendment process. To make sure the commands are amended, load ragged2e explicitly yourself.

4.2 The subfig package

Starting with v0.52 of nag, we recognize the fact that the \subfloat command from Steven D. Cochran’s subfig package is a caption-provider for its fourth argument. Earlier versions would flag use of \label as inappropriate. The current implementation works with versions close enough to v1.3 of subfig. Since the change is a one-liner, I hope it will be integrated into future versions of subfig.
4.3 The float package

Sorry, there is no way for nag to automatically add new float types to check them for captions. However, since v0.52, there is an user-level command \NagDeclareFloat that will do the bookkeeping for you, i.e. after your call to \newfloat, you call \NagDeclareFloat with the first argument to \newfloat.

4.4 The topcapt package and the subfig package

nagdemo exhibits an error when topcapt and subfig are used together, i.e. subfig thinks the caption has not been stepped already. This is not a bug in nag.

4.5 The rotating package

rotating uses \centerline to place rotated floats. As far as I can see, the usage is legitimate there, and using \centering instead would change behaviour when the float’s dimension are larger than the text body. (Currently, the height of the figure may exceed \textwidth without warning.) If this bothers you, go read the warning on p. 3 again.
4.6 Version control packages

Common version control systems like rcs, cvs, svn insert their keywords between dollar signs. Packages that parse these keywords define their commands and usually assume catcode 3, which is not true if either onlyamsmath or nag is loaded. Special handling is introduced for rcs and svninfo. In case of rcsinfo, svn and pgf (yes, it’s got internal VC handling that fails when \pgfuselibrary is used outside the preamble – thanks to Ralf Thöle for spotting this one), dollar checking is disabled.

5 Loading extensions

Finally, we deal with package options. This is simple: just try to input appropriate nag files.

869 \DeclareOption*{\InputIfFileExists{nag-\CurrentOption.cfg}{\PackageInfo{nag}{Loaded nag-\CurrentOption.cfg}}{\InputIfFileExists{\CurrentOption.nag}{\PackageWarningNoLine{nag}{Loaded old-style config file \CurrentOption.nag.\MessageBreak Consider renaming the file to nag-\CurrentOption.cfg}}{\PackageWarningNoLine{nag}{Required ruleset \CurrentOption, and it wasn’t there}}}}{\ProcessOptions*}

warnings for robustness (upper-
casing/LoF issues) ..................... 11
\nag@warn: Made robust. ................ 11

0.61alpha2
       General: fixes the warnings, with-
out generating too many dupli-
cates. ................................. 1
\nag@prepend: Creep under exist-
ing robust cover ..................... 11

0.61alpha3
       General: warns about inputs that
fail (in particular includes that
fail) and notes if a float has po-

ition t/b but is too large to
ever go into such a position (log
only). ................................. 1

0.61alpha4
       General: exempts the complaints
counter from include trickery.
(Previously, nag would get con-
fused if you include only
some chapters.) .......................... 1
       sin counter should not be saved
by include .............................. 10

0.61alpha5
       General: introduces compatibility
hacks with version control pack-
geages which rely on dollar having
constant catcode. (Workaround
for svninfo and rcs, all other
packages now disable double-
dollar checking.) ........................ 1

0.61alpha6
       General: Compatibility w/ VCS
packages, pgf .......................... 4

0.62  General: fixes a bug in the float
placement code and adds more compatibility with the caption package. 1

General: Bugfix concerning unknown command in math mode 1

General: Bugfix: math in captions catcode issue 1

General: Bigger warning if all float positions fail 8

General: Fix for marginpar etc which don’t have fps 8
